

Saumya's journey of success.

Saumya, who lives with Samagipura, is a 29-year-old motivated and hardworking young mother. Beloved mother of one son and loving wife of her husband. Living in the lower part of the Nuwaragampalatha central division of the district, she is raising chickens for the first time in her life and maintaining the garden decoration in a very orderly manner.

She does the job of a loving mother who lovingly takes care of her six-year-old toddler, and manages her

time by making taking her sons to pre-school a major part of her daily life.

It is clear to anyone who sees that the Japanese Supplementary Budget Project received the same chicken powder as the other beneficiaries, but through her dedication and contribution, the most secure methods and strategic placements have been carried out.

18 one-month-old village hens and 02 chicks were the other gift she received through the project. Fortunately for her, all the 20 chicks that she got are very healthy and healthy and have now become big animals of about 5 months old.

This young mother is very blessed by her mother's loving care. She gets the support of her mother and her beloved husband because of her previous merits. She did not neglect to take care of the chickens even during financial difficulties, and she has trained them to a nutritious diet with great interest. Her little girl's beloved pet has already become a chicken.

She gradually reduced the chicken feed provided by the market and through the training and experience she received through the project; she prepares food at home and adds nutrients to the growth of the animals.

Based on the guidance of the project, she grows a special protein and vitamin-rich plant, 'Azolla', in beautiful ponds with high technology, and adds a percentage of 25% of the food rations provided as dry food.

Adding protein-rich worms produced by the black soldier fly, which is the latest experiment of the project, to the food of the chickens, she carefully prepares them in a special health-safe manner and successfully replaces them in the daily diet and gives them to the animals.

It adds another 25% contribution to food. She says with great pride that her special food methods have been evaluated and praised by the animal health and production department of the government, and it is also a great blessing to those who are engaged in animal husbandry in her village. Today, the result of her efforts and dedication is to obtain high quality nutritious village hen eggs from her hens. She collects about 10

chicken eggs a day, which is the main goal of the project, and reflects the family's need for protein nutrition through eating eggs.

It should be said that adding an egg to one's family meal is a great comfort especially for the child's nutrition.

They started laying eggs recently, but due to getting proper nutrition, the rate of egg laying has increased and now they have started earning extra income by selling 6 eggs per day to their village shop.

Having described her success in this way, she also added her contribution to the project and did not forget to express her heartfelt thanks. We also pay our respects to her for her endless dedication.
