

Empowering Women in Agriculture: R.M.Lanka's Journey of Innovation and Dedication in Farming Practices

Lanka is an exceptional woman who has demonstrated remarkable dedication and innovation in her farming practices. Despite encountering traditional methods that were not producing satisfactory results, she took advantage of the opportunity presented by the Japanese Supplementary Budget Project to enhance her farming techniques.

Lanka is a progressive female farmer who earns her livelihood through livestock rearing and growing other field crops such as Green gram, kaupi, black gram, peanuts, and vegetables. Her hard work and dedication paid off when she received 18 one-month-old village hens and 2 chicks through a project. Lanka took great care of the chickens, ensuring their optimal care, and strategic placement, which led to their healthy growth and development. She never neglected her responsibilities towards the chickens, even training them to consume a nutritious diet prepared at home, despite facing financial difficulties. This project was a turning point for her, and she proved that with determination and hard work, one can overcome any obstacle.

With the help of the project's guidance, Lanka implemented innovative practices like cultivating 'Azolla', a protein and vitamin-rich plant, to augment the diet of her chickens. Her dedication to producing top-quality eggs was acknowledged by the animal health and production department of the government, further validating her efforts.

This mother is fortunate to have the loving care and support of her mother and beloved husband, which she believes is due to her previous good deeds. Even during financial difficulties, she did not neglect to take care of her chickens and has trained them to have a nutritious diet with great interest. Her little girl's pet, which was a chicken, has become a beloved pet for the family.

Today, thanks to her hard work and dedication, she is able to obtain high-quality, nutritious eggs from her village hens. She collects approximately 18 eggs per day, which is the main goal of her project. The eggs provide her family with the protein they need, and she also sells 12 eggs per day to the egg collecting center, earning 600 LKR per day. As a result, her family's monthly income has increased by 18000 LKR.

Lanka was able to achieve her goal of producing nutritious eggs from village hens to provide protein for her family. She used the chicken manure to improve the yield of her farm, and this helped her become a successful businesswoman.

Lanka's story is a striking example of how dedication, innovation, and collaboration can drive agricultural development. Her journey from being a struggling farmer to becoming a successful entrepreneur exemplifies how effective support programs and individual initiatives can create sustainable livelihoods. This is a fact that highlights the success of the project and the sense of self-satisfaction that comes from it.
