

From Clucking Hens to Clusters of Success: Nirupa's Inspiring Journey

Nirupa is a 41-year-old motivated cluster leader and a hardworking young mother who lives with her husband in Rathmale. She is a beloved mother of one son. They live in the lower part of the Rathmale GN division central division. Nirupa is raising chickens for the first time in her life and maintaining the garden decorations in a very orderly manner. She does the job of a loving mother who lovingly takes care of her six-year-old toddler, and manages her time by making taking her sons to pre-school a major part of her daily life.

It is evident that the Japanese Supplementary Budget Project received the same benefits as other beneficiaries. However, due to her dedication and contribution, the most secure methods and strategic placements have been implemented.

As per the project, she received 18 one-month-old village hens and 2 chicks as gifts. Luckily, all 20 chicks are in good health, and they belong to the improved breeds. They have now matured and are around 5 months old.

This young mother is fortunate to have the loving care of her mother. With the support of both her mother and her beloved husband, she feels blessed due to her previous good deeds. Despite facing financial difficulties, she never neglected her chickens and always took good care of them. She trained them to have a nutritious diet with great interest. Her little girl's beloved pet has now grown up to be a chicken.

Based on the guidance of the project, she grows a special protein and vitamin-rich plant, 'Azolla', in beautiful ponds with high technology, and reduced a percentage of 25% of the commercial feed rations.

Adding protein-rich worms produced by the black soldier fly, which is the latest experiment of the project, to the food of the chickens, she carefully prepares them in a special health-safe manner and successfully replaces them in the daily diet and gives them to the animals.

Today, the result of her efforts and dedication is to obtain high quality nutritious village hen eggs from her hens. She collects about 15 chicken eggs a day, which is the main goal of the project, and reflects the family's need for protein nutrition through eating eggs.

It should be said that adding an egg to one's family meal is a great comfort especially for the child's nutrition.

They started laying eggs recently, but due to getting proper nutrition, the rate of egg laying has increased and now they have started earning extra income by selling 10 eggs per day to the egg collectors.

She described her success, contributed to the project, and expressed gratitude for her team's endless dedication.
